Titanic animation as seen on The Discovery Channel available for use in your planetarium...

The Titanic is an ongoing popular story and has great potential in the planetarium environment... and if your museum or science center is planning to host one of the traveling Titanic exhibits, a perfect tie-in. We are happy to offer the same animation sequences used by The Discovery Channel in its documentary series on the Titanic... made available by Home Run Pictures who worked with Discovery to produce the broadcast series.

The scenes follow all the key points in the sinking of the oceanliner, from surface events to the present ocean bottom wreck site. The all-dome versions feature an accurate starfield, so stories dealing with what survivors saw in the sky that night can coexist with your dome's sky projector.

Presently, there are approximately 15 minutes of Titanic imagery available in standard video, of which about 4 minutes are also rendered in all-dome format if you have that capability. We also have all the animation scene and model data archived from the Discovery documentaries, so it would be relatively easy to create specific additional imagery to fit your specific needs. We can aid you with creative production services... from development of initial concept to scripting, storyboarding, technical directing and management of production guaranteeing delivery of your project for your premier showing.
